Available online 11 April 2007

Fig. 1. A counterexample.

As shown in Fig. 1, the nearest point on a Bézier curve in \mathbb{R}^3 space with the control points $\{P_i\}$ to the test point P is P_c , while from the algorithm in (Ma and Hewitt, 2003), the nearest point is P_5 , which is an end point of the curve.

Acknowledgements

The research was supported by Chinese 973 Program (2004CB719400, 2004CB318000) and the National Science Foundation of China (60403047, 60533070, 60473130). The third author was supported by the project sponsored by a Foundation for the Author of National Excellent Doctoral Dissertation of PR China (200342) and a Program for New Century Excellent Talents in University (NCET-04-0088).
